

**Comparison with the state level as well as the  
relationship of Stress, Resilience and Psychological  
Health between UK and China:  
A Newest Cross-sectional global Study in  
undergraduate nursing students**

**Fang Yang  
RN,PhD,Associate Professor  
Hangzhou Normal University**

# CURRICULUM VITAE

## Personal details

Date: April 2013

Name: Fang Yang (RN,MSN,PhD)

Current Post: Associate Professor /Master Degree Supervisor/Course director(China)  
Post-doctoral Fellow/Research Assistant/Academic visitor(UK)

# Aims of this study

To explore the state level as well as the relationship of stress, resilience, and psychological health in nursing students in the UK and China.

Also try to search for a strategy to find an effective way to ease stress and psychological distress in nursing education program to make it more healthy for participants.

# Background

- ◆ **Stress and psychological distress** in student nurses has been **widely demonstrated** and present globalization trend including China.
- ◆ **Resilience has been described as a personal resource** that can influence an individual's ability to cope with the negative effects of stress and have strength to deal with adverse experiences.
- ◆ To date, **little research has been done** to examine the relationship of both stress and psychological health with **resilience** in these population in nursing area.

# Study on Resilience

# Derive and development

**Resilience is derived from the French word "resile" , means bounce back. Study of resilience is begun from 1970's.**

## **Development of three stage:**

**Early period( 1970~ 1990) Characteristics and protective factors**

**Medium term ( 1990~ 2000) Dynamical processes**

**Last period( 2000~Now) Involved in Positive Psychology**

# Definition of Resilience

◆ Resilience as a personal resource that can influence the individual's ability to avoid the potentially deleterious effects of stress and make the necessary protective strength under adverse experience, as well as the ability to bounce back from adversity as most research of resilience concluded. (Wagnild(1997,2003) and Dyer(1996) )

◆ Resilience refers to positive adaptation although faced with adversity, trauma, tragedy, threat, or other much pressure. (American Psychology Association )

# The resilience scale

Resilience Scale includes 25 items reflecting five characteristics which is served as the conceptual foundation for resilience (Wagnild & Young)

- ◆ **Equanimity**, which is a balanced perspective of individual life and experiences when encountering adversity.
- ◆ **Meaningfulness**, which means the perception that life has a purpose and realization that there exist something for living.
- ◆ **Perseverance**, refers to the willingness to proceed with reconstructing life and connoting the ability to keep going despite set backs or discouragement.
- ◆ **Existential aloneness**, implied the recognition of each person's unique path and acceptance of one's life.
- ◆ **Self-reliance**, assessed the belief in one's self and capabilities when facing with adversity. (Wagnild & Young, 1990, 1993).

# Consequence of Resilience

**Physical Health**

**Mental Health**

**Subject Well-being**

**Quality of Life**

## Study Design

**This study employed a cross-sectional research design.**

## ❖ Instrument and survey procedure

**Resilience Scale(C-RS)(Resilience )**

**Stress in nursing students Scale(C-SINS)  
(Stress )**

**General Health Questionnaire-12(C-GHQ-12)  
(Psychological Distress)**

# Method

## Sample and data collection

- ◆ The participants were **1538 Chinese Nursing students** from three Nursing School of Universities, Hangzhou.
- ◆ The inclusion criteria were being student **nurses in Nursing School**, the clear thinking and good language communication ability, Voluntarily participate in this study. Nurses were not included if not voluntary.
- ◆ **1538 student nurses** received **face to face interview** and completed the questionnaire after filling the formal informed consent.

# Sampling method

**Convenient sampling method were used for this study.**

# Method

## Data analysis

- ◆ All analyses were performed using the Statistical Package for the Social Sciences (SPSS) for Windows version 18.0 (SPSS Inc., Chicago, IL, USA).
- ◆ Statistical evaluations were at 2-tailed tests, with p values of less than 0.05 considered as significant. **Cronbach's alpha coefficients** was used to determine the correlation among resilience, stress and psychological distress.
- ◆ **Descriptive statistic analysis, correlation analysis as well as stepwise multiple regression analysis** were examined on matching pairs of data.

## Ethical Consideration

◆ The study protocol was approved by the Research Ethics Committee of Hangzhou Normal University as well as the other two universities.

# Result

- ◆ The mean score of resilience was 121.84 (SD=21.30).
- ◆ A comparison of the scores for the dimensions of the SINS showed a relative difference in terms of mean scores and in descending order.
- ◆ The mean score of psychological health was 6.20 (SD=1.83).
- ◆ Resilience was found to be related significantly with stress and psychological health with the correlation coefficient is -0.195 and 0.064 respectively.

**Description of this current study**

**Discussion of this current study**

# Conclusion

- ◆ This study illustrated that resilience was a stronger predictor of stress and psychological health including in China and UK.
- ◆ Future research will be carried out to implement the strategies or interventions including conducting nursing education programs and competencies in enhancing resilience in global nursing research.

A close-up, artistic photograph of a fountain pen with a dark, polished barrel and a silver-colored nib. The pen is positioned diagonally across the upper left portion of the frame. The background is a blurred, high-contrast image of a document with text, possibly a book or a letter, with some words like "services" and "from" visible. The overall color palette is cool, dominated by blues and greys.

# Thank You !
